- A package for sheets, for example sheet information carriers such as CD-sheets, DVD, CDR, CD-RW and so on and comprising an outer envelope (3) and an inner envelope (4) formed separately or in one and a same piece together with said outer envelope, manufactured by carton, paper, plastic, wellpapp or the like, which have been double folded to constitute a cover protecting the sheets or the actual sheet (2) at the same time as said inner envelope (4) supports and partly encloses said sheet (2), so that from the inside (13;14) of the outer envelope (3) close to its back portion (5) said inner envelope (4) extends in a direction forwards and comprises at least one open space (6) delimited laterally by a double fold (7) on each side, which has a length forwards extending past the half diameter of the stored sheet (2), characterized in that during the closed position and up to is mainly half open position of the package (1) or immediately before the half opened position said space has an opening width which, after the (6) extension forwards of the double fold past the half diameter of the stored sheet (2), is less than the diameter of the by that the double folds (7) converge in a sheet (2) direction towards each other in order to prevent a sliding out of said sheet (2) from the space (6), and during the continued opening of the package (1) and up to its totally opened position said space (6) has an opening width, which is greater than the diameter of the sheet and makes it easy to take out from the space.
- 2. A package according to claim 1, characterized in that during the continued opening of the package and up to its totally opened position the space (6) having the sheet (2) in the same is automatically lifted upwards in order to expose the sheet (2) at the same time as the sheet is easy to grip.
 - 3. A package according to claim 1, characterized in that each double fold (7) is constituted by two portions (8,9) folded towards each other along at least one outer crasing

line (C), which are via upper and lower crasing lines (A,B) 5 foldable formed in said inner envelope (4), said upper crasing lines (A) each extend into their portion (10), which in turn is foldable as symmetrically connected via crasing lines (D) with a portion (11), delimited forwards by the last mentioned crasing lines (D) and backwards by a crasing line 10 (E) extending laterally the width of the outer- and inner envelope (3,4), which extends into a portion (12), which foldable extends into any of the insides (13;14) of the outer envelope (3), i.e. the inside of the front- or backside, a short distance from its back portion (5) via a flap (17), 15 which is fixed against the first inside (13) and which extends into a direction towards the back portion (5) or in an opposite direction towards the first inside (13) at the same time as the lower crasing lines (B) of the double fold (7) extend into a portion (15), which via crasing lines (G) 20 foldably extend into portions (16), which are fixed against the other inside (14) of the outer envelope (3).
